			ART UNIT	PAPER NUMBER
			2133	

DATE MAILED: 07/11/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b> 10/620,964	<b>Applicant(s)</b> CUTTNER ET AL.	
	<b>Examiner</b> Mujtaba K. Chaudry	<b>Art Unit</b> 2133	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 02 May 2006.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-19 and 40-58 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-19 and 40-58 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 15 July 2003 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

### **DETAILED ACTION**

Claims 1-19 and 40-58 are present for examination. Claims 20-39 have been withdrawn from consideration due to restriction.

#### ***Information Disclosure Statement***

The references listed in the information disclosure statements (IDS) submitted on July 15, 2003 and January 22, 2004 have been considered. The submission is in compliance with the provisions of 37 CFR 1.97.

#### ***Oath/Declaration***

The Oath filed January 22, 2004 complies with all the requirements set forth in MPEP 602 and therefore is accepted.

#### ***Drawings***

The drawings are objected to because:

- Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed

of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Appropriate correction is required.

### ***Specification***

The specification is objected to because:

- The title of the invention should appear on line 1 of page 2.
- The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors.

Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claim 1 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. It is not clear what the Applicants refer to as “data package” and “data element” as these terms are not normally used in the art. The Examiner will interpret these terms in accordance with MPEP 2111. Perhaps it should state “data packet” and “data bit” respectively. Other independent claims inherit similar issues that should be fixed as well. Applicants are

Art Unit: 2133

reminded to correct terminology in dependent claims (if applicable) when making corrections to avoid unnecessary antecedent issues.

***Claim Rejections - 35 USC § 103***

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-19 and 40-58 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kato (USPN 5844918) further in view of Applicants Admitted Prior Art (AAPA).

As per claim 1, Kato substantially teaches (abstract and Figure 4) a data transmission and reception apparatus wherein an error correcting code including of basic data and a BCH-based parity code appended to thereto is divided into smaller packets. The Examiner would like to point out that basic data as taught by Kato is shown in Figure 5 to comprise of multiple packets, which is analogous to a data package with at least two data elements. Kato teaches that an error detecting code (analogous to code point values) is appended to each of the thus-divided packets, so that transmission basic data is formed. When the transmission basic data is received, the basic data and a BCH-based parity code are derived from the transmission basic data. Error correcting is carried out with respect to the overall transmission basic data. An error detecting operation is

Art Unit: 2133

carried out with respect to each packet using the error detecting code. If a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

Kato does not explicitly teach to separately receive the code point values corresponding to the data package as stated in the present application.

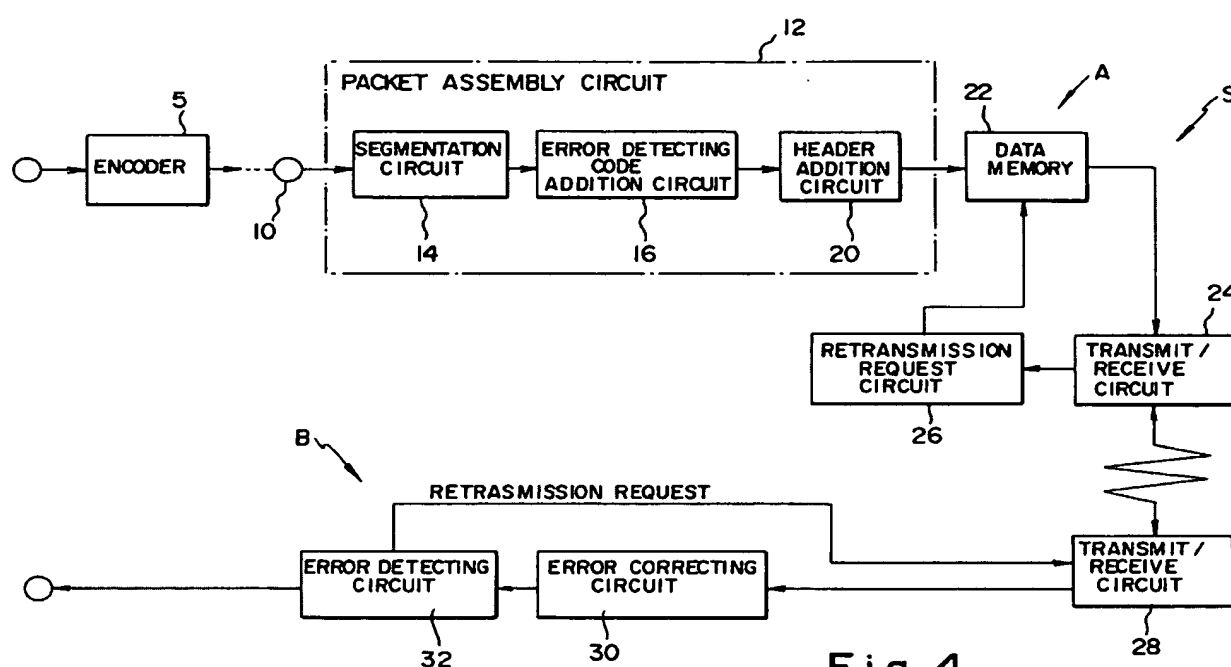

Fig. 4

However, Kato teaches (Figure 4) in the data receiver B, the following operations are carried out, as shown in FIG. 6 and FIGS. 7a to 7d. To begin with, the transmit/receive circuit 28 receives the transmission data packet. The thus-received transmission data packet has such a configuration as shown in FIG. 7a. After all of the transmission data packets including the BCH code have been received, the error correcting circuit 30 corrects errors in the basic data using the BCH code (in S21 and S22 in FIG. 6). In short, the error correcting circuit 30 derives the basic data BD and the BCH-based parity code BCHD which acts as an error correcting

parity code, from the received data packet. Then, errors in the basic data are corrected using the BCH code, as shown in FIGS. 7b and 7c. The BCH code includes the basic data BD and the BCH-based parity code BCHD. More specifically, all the three data packets rather than each data packet, as a whole, are subjected to the error correcting operation. As a matter of course, *the CRC codes of the received data packets are separately maintained.* There may be a case where errors arising in transmission can be corrected by the error correcting operation.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the data transmission method of Kato by transmitting the data and the code point values/ error detection code separately. This modification would have been obvious to one of ordinary skill in the art at the time the invention was made because one of ordinary skill would have recognized that transmitting data and corresponding code point values separately would have increased synchronization capabilities.

As per claim 2, Kato substantially teaches, in view of above rejection, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 3, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that once a request for retransmission is made then that packet for which the request is made for is no longer used and hence discarded.

As per claim 4, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action.

As per claim 5, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 6, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that once a request for retransmission is made then that packet for which the request is made for is no longer used and hence discarded.

As per claim 7, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred.

As per claim 8, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that it would have been an obvious engineer design choice to have a watermark embedded in the digital packet and use that to determine in the received packet is valid or not. It is well known in the art for computer files, for example, to have digital watermarks in them as patterns of bits, which appear to be a part of the file and are not noticeable to the user and can be used to detect unauthorized copies.

As per claim 9, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made

when the characteristic of the particular data element is not useful or when an error has occurred and is not correctable.

As per claim 10, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, which is first network component to second network component.

As per claim 11, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, which is first network component to second network component.

As per claim 12, Kato substantially teaches, in view of above rejections, (abstract and Figure 4) a data transmission and reception apparatus wherein an error correcting code including of basic data and a BCH-based parity code appended to thereto is divided into smaller packets. The Examiner would like to point out that basic data as taught by Kato is shown in Figure 5 to comprise of multiple packets, which is analogous to a data package with at least two data elements. Kato teaches that an error detecting code (analogous to code point values) is appended to each of the thus-divided packets, so that transmission basic data is formed. When the transmission basic data is received, the basic data and a BCH-based parity code are derived from the transmission basic data. Error correcting is carried out with respect to the overall transmission basic data. An error detecting operation is carried out with respect to each packet using the error detecting code. If a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

Kato does not explicitly teach to receive the code point values corresponding to the data package from a second network component as stated in the present application.

However, Kato teaches (Figure 4) in the data receiver B, the following operations are carried out, as shown in FIG. 6 and FIGS. 7a to 7d. To begin with, the transmit/receive circuit 28 receives the transmission data packet. The thus-received transmission data packet has such a configuration as shown in FIG. 7a. After all of the transmission data packets including the BCH code have been received, the error correcting circuit 30 corrects errors in the basic data using the BCH code (in S21 and S22 in FIG. 6). In short, the error correcting circuit 30 derives the basic data BD and the BCH-based parity code BCHD which acts as an error correcting parity code, from the received data packet. Then, errors in the basic data are corrected using the BCH code, as shown in FIGS. 7b and 7c. The BCH code includes the basic data BD and the BCH-based parity code BCHD. More specifically, all the three data packets rather than each data packet, as a whole, are subjected to the error correcting operation. As a matter of course, *the CRC codes of the received data packets are separately maintained.* There may be a case where errors arising in transmission can be corrected by the error correcting operation.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the data transmission method of Kato by transmitting the data and the code point values/ error detection code from different network components. This modification would have been obvious to one of ordinary skill in the art at the time the invention was made because one of ordinary skill would have recognized that transmitting data and corresponding code point values from different network components would have increased synchronization capabilities.

As per claim 13, AAPA substantially teaches, in view of above rejections, (figure 1) the first network component to be a set top box. The Examiner would like to point out that this is just an example of a transmitter, which—by the way—can be named anything so long as digital data is transmitted.

As per claim 14, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, wherein at the receiver is the error detection/correction which has to monitor the incoming data and log it accordingly to maintain accuracy of the data packets that need retransmission.

As per claim 15, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action.

As per claim 16, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action and the invalid packet is not used.

As per claim 17, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 18, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the

sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred.

As per claim 19, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred and is not correctable.

As per claim 40, Kato substantially teaches, in view of above rejection, (abstract and Figure 4) a data transmission and reception apparatus wherein an error correcting code including of basic data and a BCH-based parity code appended to thereto is divided into smaller packets. The Examiner would like to point out that basic data as taught by Kato is shown in Figure 5 to comprise of multiple packets, which is analogous to a data package with at least two data elements. Kato teaches that an error detecting code (analogous to code point values) is appended to each of the thus-divided packets, so that transmission basic data is formed. When the transmission basic data is received, the basic data and a BCH-based parity code are derived from the transmission basic data. Error correcting is carried out with respect to the overall transmission basic data. An error detecting operation is carried out with respect to each packet using the error detecting code. If a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that digital data transmission and reception is not possible without computer implementation and therefore inherently, Kato's system has to have computer and computer-readable medium, i.e. software to actually perform transmission.

Kato does not explicitly teach to separately receive the code point values corresponding to the data package as stated in the present application.

However, Kato teaches (Figure 4) in the data receiver B, the following operations are carried out, as shown in FIG. 6 and FIGS. 7a to 7d. To begin with, the transmit/receive circuit 28 receives the transmission data packet. The thus-received transmission data packet has such a configuration as shown in FIG. 7a. After all of the transmission data packets including the BCH code have been received, the error correcting circuit 30 corrects errors in the basic data using the BCH code (in S21 and S22 in FIG. 6). In short, the error correcting circuit 30 derives the basic data BD and the BCH-based parity code BCHD which acts as an error correcting parity code, from the received data packet. Then, errors in the basic data are corrected using the BCH code, as shown in FIGS. 7b and 7c. The BCH code includes the basic data BD and the BCH-based parity code BCHD. More specifically, all the three data packets rather than each data packet, as a whole, are subjected to the error correcting operation. As a matter of course, *the CRC codes of the received data packets are separately maintained.* There may be a case where errors arising in transmission can be corrected by the error correcting operation. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the data transmission method of Kato by transmitting the data and the code point values/ error detection code separately. This modification would have been obvious to one of ordinary skill in the art at the time the invention was made because one of ordinary skill would have recognized that transmitting data and corresponding code point values separately would have increased synchronization capabilities.

As per claim 41, Kato substantially teaches, in view of above rejection, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 42, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that once a request for retransmission is made then that packet for which the request is made for is no longer used and hence discarded.

As per claim 43, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action.

As per claim 44, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 45, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that once a request for retransmission is made then that packet for which the request is made for is no longer used and hence discarded.

As per claim 46, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred.

As per claim 47, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that it would have been an obvious engineer design choice to have a watermark embedded in the digital packet and use that to determine in the received packet is valid or not. It is well known in the art for computer files, for example, to have digital watermarks in them as patterns of bits, which appear to be a part of the file and are not noticeable to the user and can be used to detect unauthorized copies.

As per claim 48, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred and is not correctable.

As per claim 49, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, which is first network component to second network component.

As per claim 50, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, which is first network component to second network component.

As per claim 51, Kato substantially teaches, in view of above rejections, (abstract and Figure 4) a data transmission and reception apparatus wherein an error correcting code including

Art Unit: 2133

of basic data and a BCH-based parity code appended to thereto is divided into smaller packets. The Examiner would like to point out that basic data as taught by Kato is shown in Figure 5 to comprise of multiple packets, which is analogous to a data package with at least two data elements. Kato teaches that an error detecting code (analogous to code point values) is appended to each of the thus-divided packets, so that transmission basic data is formed. When the transmission basic data is received, the basic data and a BCH-based parity code are derived from the transmission basic data. Error correcting is carried out with respect to the overall transmission basic data. An error detecting operation is carried out with respect to each packet using the error detecting code. If a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that digital data transmission and reception is not possible without computer implementation and therefore inherently, Kato's system has to have computer and computer-readable medium, i.e. software to actually perform transmission.

Kato does not explicitly teach to receive the code point values corresponding to the data package from a second network component as stated in the present application.

However, Kato teaches (Figure 4) in the data receiver B, the following operations are carried out, as shown in FIG. 6 and FIGS. 7a to 7d. To begin with, the transmit/receive circuit 28 receives the transmission data packet. The thus-received transmission data packet has such a configuration as shown in FIG. 7a. After all of the transmission data packets including the BCH code have been received, the error correcting circuit 30 corrects errors in the basic data using the BCH code (in S21 and S22 in FIG. 6). In short, the error correcting circuit 30 derives the basic data BD and the BCH-based parity code BCHD which acts as an error correcting

parity code, from the received data packet. Then, errors in the basic data are corrected using the BCH code, as shown in FIGS. 7b and 7c. The BCH code includes the basic data BD and the BCH-based parity code BCHD. More specifically, all the three data packets rather than each data packet, as a whole, are subjected to the error correcting operation. As a matter of course, *the CRC codes of the received data packets are separately maintained*. There may be a case where errors arising in transmission can be corrected by the error correcting operation.

Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the data transmission method of Kato by transmitting the data and the code point values/ error detection code from different network components. This modification would have been obvious to one of ordinary skill in the art at the time the invention was made because one of ordinary skill would have recognized that transmitting data and corresponding code point values from different network components would have increased synchronization capabilities.

As per claim 52, AAPA substantially teaches, in view of above rejections, (figure 1) the first network component to be a set top box. The Examiner would like to point out that this is just an example of a transmitter, which—by the way—can be named anything so long as digital data is transmitted.

As per claim 53, Kato substantially teaches, in view of above rejections, (Figures 4 and 5) shows data to be transmitted in packets associated with error detection/correction data. The data and error detection/correction is shown to be transmitted from the transmitter to the receiver, wherein at the receiver is the error detection/correction which has to monitor the incoming data and log it accordingly to maintain accuracy of the data packets that need retransmission.

As per claim 54, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action.

As per claim 55, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. Requesting for retransmission of the invalid packet is a corrective action and the invalid packet is not used.

As per claim 56, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side.

As per claim 57, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred.

As per claim 58, Kato substantially teaches, in view of above rejections, (abstract) that if a packet is found to contain errors, a request for retransmission of that packet will be sent to the sending side. The Examiner would like to point out that a request for retransmission is made when the characteristic of the particular data element is not useful or when an error has occurred and is not correctable.

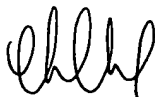

*Conclusion*

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Additional pertinent prior arts are included herein for Applicant's review.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mujtaba K. Chaudry whose telephone number is 571-272-3817. The examiner can normally be reached on Mon-Thur 9-7:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Albert DeCady can be reached on 571-272-3819. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
